Appendix A: Methodology

Study Design

This report discusses findings from the fourth wave of a longitudinal study of a cohort of Jewish young adults who were applicants to Taglit-Birthright Israel, a program that sends 18-26 year olds on a free ten-day educational trip to Israel. This study focuses on the applicants and participants in the first six years of Taglit’s operation (2001-06). These years were chosen as the focus of this study to ensure that sufficient time would have elapsed since application (and trip experience) for individuals to form families and settle into adult communal roles. Applicants to these rounds reflect the diversity of the applicant pool during the life of the program.

The study was designed to achieve its full panel size and composition over the course of three years. The first wave of the study was conducted in 2009 with a sample of individuals who applied to the program in the years 2001-04. In 2010, the original sample was contacted again for the second wave of the study. In addition, the original sample was expanded to include a new sample from the cohort of individuals who applied to the program in 2005. In 2012, for the third wave of the study, all members of the original sample and 2005 cohort were contacted again, and once more the sample was expanded with inclusion of applicants from 2006. In 2013, for the fourth wave of the study, no new cohorts were added. Hence, the sample for Wave 4 (2013) of the study was the same as the sample used in Wave 3 (2012).

Sampling frame

The population for this study is comprised of eligible applicants (both participants and nonparticipants) to Taglit in the winter rounds of 2001, 2002, 2003, 2004, 2005, and 2006. The relative size of the total applicant cohort and percent of the cohort sampled for the current study is detailed in Table 2 below. The sampling procedure and composition of the initial sampling frame for this study is explained in detail in Appendix 3 of Saxe et al. 2009 (pp. 10-12). Equivalent information for the 2005 and 2006 cohort samples can be found in the methodological appendix of the report corresponding to the wave in which these cohorts were added (Saxe et al 2011 and Saxe et al 2012 respectively).

Note: Winter 2001 includes only information on participants (nonparticipant information is not available). Winter 2001 applicants with missing information on age and sex were excluded from the sampling frame and treated as ineligible. The sampling frame figures in this table were updated in Wave 4 to reflect newly discovered ineligible applicants and duplicate records in the registration database.

Sample

The sample for this study was drawn to represent participants and nonparticipants during specific years of Taglit’s operation and were stratified to over- or under-represent certain subpopulations (such as older participants). In general, cases were eligible for inclusion in the sample if they had a primary or secondary residence in the United States at the time of most-recent application to the program, had information on date of birth and sex, had some contact information, and were eligible for participation in the program itself.

Cases that were included in samples in previous waves were surveyed again in Wave 4, using the same stratification scheme as previous waves of the study. This includes individuals who applied to the program in rounds 2001, 2002, 2003, 2004, 2005, and 2006. Some individuals sampled in previous waves were subsequently found to be ineligible for the study; these individuals were removed from the sample and their survey data from previous waves was removed. Sample members that refused to participate in any previous waves were not contacted again and automatically designated as nonrespondents.

Ineligible cases

Ineligible for the program - The study design focuses on eligible applicants (participants and nonparticipants) to the winter rounds of 2001-06. Initial eligibility to the program (which is recorded in the registration system) is determined by an algorithm that considers the applicant’s answers to a series of questions. Final eligibility is determined later on when individuals are considered for the trip and undergo a personal interview. While the initial eligibility “flag” identifies most applicants correctly, some are discovered to be ineligible for the program later on (usually because they omitted information when completing the registration form or information was recorded in text fields not accounted for in the algorithm). As the number of applicants has always exceeded available slots by a large margin, many applications of those who didn’t go were never considered and their final eligibility was never determined. The underlying assumption on which sample selection was based is that all individuals are only represented once in the registration system and are correctly identified as eligible to the program by the eligibility flag. Because all participants undergo an additional verification of their information, their eligibility to the program was not questioned. For nonparticipants, information that was collected during the survey contributed to the disqualification of a significant number of individuals from the study—as they should have not been considered eligible for the program. In particular, in Wave 3 a module designed to collect information on all of the respondent’s trips to Israel proved particularly
useful in identifying a number of cases that were ineligible to the program due to prior peer travel to Israel, but were not identified as such in the registration database. In a few cases, Taglit staff or administrators were incorrectly classified as applicants in the registration system and were also considered to be ineligible once they were discovered.

Out of study time period – There were also cases where an individual was thought to be an eligible nonparticipant but was later found to have been a participant on a later Taglit trip that was not in the scope of the study or had staffed a trip (without participating). Most often this was the result of duplicate entries in the registration database that were not merged together. Although the database was cleaned in an effort to eliminate duplicate entries, some duplicates remain, specifically where a computerized algorithm could not eliminate these duplicates.

Deceased – All individuals who passed away before the study commenced were considered ineligible for the study. Individuals who passed away during the course of the study were considered eligible only for study waves that were administered before they passed away.

In most cases, individuals who were found to be ineligible for the study for the reasons mentioned above were omitted from all weighting and analyses, even if their survey was complete. However, in a few cases an individual who was sampled as a nonparticipant participated in a Taglit trip between two waves of the study (e.g. in 2010 or 2011) or the sampled individual died sometime after the first wave of the study was administered. In both of these situations the individual is considered eligible when analyzing data collected before the event (death, or participation in Taglit) that caused them to become ineligible for subsequent waves of the study (see Table 3).

**Refusals**

Some individuals refused to participate in the survey, either by indicating their preference to a caller, by sending an email to the study’s email account, or by opting out using an “opt-out” link included in the email invitation. A field operations manager reviewed all refusals in order to determine whether a refusal conversion should be attempted. Individuals who were deemed “hard refusals” were not contacted again for subsequent waves of the study. The majority of refusals were of individuals who were not interested in participating in the study altogether. Over the four years of data collection, 649 individuals have refused to participate in the survey at some point. Of those, 175 completed at least one wave of the survey before refusing to participate in any further waves.
Enhancing quality of contact information

Shortly after data collection for Wave 3 was completed, contact information for both respondents and nonrespondents was reviewed and recorded in the study’s database. All verified contact information was kept (including phone numbers and email addresses) and annotated. All other information was archived. Contact information was then reviewed to determine its quality, and the likelihood of it leading to a successful contact in Wave 4 was determined. In this process, all cases included in Wave 3 of the study were coded with two fields: contact potential (0=none, 1=low, 2=medium, 3=high) and search potential (0=no potential, all resources exhausted, 1=not fully searched, should be tried again). Prior to administration of Wave 4, all cases with potential 0/0, 0/1, 1/0, and 1/1 were searched. The search protocol included trying all contact information on file to verify usability and searching for new contact information if existing information was deemed to lead to dead ends. Paper letters inviting sampled individuals to take part in the study were sent to individuals who did not have any other form of contact information or where no contact was made via phone/email. Searches were conducted between 10/16/2012 – 02/11/2013. The search process included utilizing online sources to obtain additional contact information for either the respondent or a close relative. This included the subscription-based online data service site Accurint, as well as public whitepages directories such as www.anywho.com and www.whitepages.com. Searchers also used their own accounts on the social network site www.linkedin.com and a researcher account on Facebook to locate contact information. In addition, searchers used search engines such as Google to attempt to find any information they could about potential respondents. Sometimes a personal website, wedding announcement, home-business website or page for an event such as a political campaign was located, and any email addresses, phone numbers and physical addresses provided were used to try to contact the respondent or any other individual who might know how to reach them. When respondents were reached, they were asked to verify their date of birth and were enlisted to participate in the study. At the end of the process, new potentials were assigned to each case that was searched. In this process 384 cases were searched. Some of these cases were of sample members who were never reached in the past; others were of respondents to an early wave whose contact information did not lead to a successful contact later on.

Contact potential grouping

All eligible sample members were grouped based on their responses to previous surveys and the quality of their contact information. There were 2,206 individuals who had completed one or more previous surveys (Wave 1, Wave 2, or Wave 3). Since good quality contact information of some form existed for these individuals, they were considered as a single group. In addition, since significant demographic information was already known for this group (due to their response to previous surveys), they were administered a separate survey with complex branching logic to ensure they were not asked redundant or non-applicable questions.

Individuals who had not responded to any previous survey, or who had only partially completed a previous survey, were grouped by the predicted likelihood of contact. One hundred and ninety-two individuals had not completed any previous survey, but a subjective overview of the available contact information for these individuals implied a reasonably “high” probability of contact in Wave 4. In addition, 323 eligible individuals had not responded to any prior survey and had a “medium” probability of contact. Finally, 135 individuals were determined to have a relatively “low” probability of contact, meaning that only unconfirmed contact information (i.e., contact information that had not been confirmed to actually belong to the respondent) was available for these cases. An additional 100 cases were determined to have no useable contact information and no potential for subsequent contact. These cases were not surveyed.

### Incentives

As in previous waves, respondents were informed that completion of the full survey (either online or over the phone) would earn them a $25 Amazon.com gift certificate. At the end of the instrument respondents were asked to provide an email address to which the gift code could be sent. Respondents were given the opportunity to opt-out of receiving a gift card; 28 respondents did so.
Field Operations

The Web survey was designed using an online instrument, created in LimeSurvey (Schmitz, 2009). However, the survey was administered as a dual-mode telephone and Web survey, with phone interviewers using the online survey instrument to input the respondents’ answers. The Web survey was designed with multimode use in mind, with the aim of minimizing mode effects (Dillman, 2007). For respondents who participated in the study in previous waves, web survey was the predominate mode of data collection. Over 90 percent of all surveys were collected via the web (see Table 5). Phone interviewers were instructed to attempt to complete an interview whenever they made contact with a respondent. If necessary, callbacks were scheduled. Many respondents, even when contacted by phone, preferred completing the survey online independently and requested that an email containing the unique URL to the survey be sent to them.

Survey launch

The survey was launched on March 4, 2013. Contact attempts with respondents were staggered based on their “contact potential” grouping. Survey launch began with phone and email contact with individuals in the “high” contact potential grouping. No mass email was sent. Callers were instructed to either complete a survey over the phone or if no contact was made to leave a VM, and if applicable, send an invitation email that included a unique link to the survey. Calling for the “medium” potential grouping followed on March 7 and calling for the “low” potential group 4 started on March 13.

All respondents from Waves 1 to 3 who had previous email addresses were sent an email invitation to participate in the survey on March 13, 2013. An initial “soft launch” was attempted with emails being sent to 100 respondents. After several respondents had completed the survey the remainder of the emails was sent. Invitations were sent to emails associated with respondents in the study database. The email invitation was followed by two email reminders spaced about one week apart. Invitations and reminders explained the study and included a unique link for completing the survey online (see Appendix 4). Reminders were only sent to those who had not completed the survey at that point. Invitations and reminders were worded slightly differently to target previous respondents and those who did not previously participate in the study. Two days after the second email reminder was sent, callers began to contact all nonrespondents by phone.
Calling

Callers made every effort to locate potential respondents or any individual who could provide up-to-date contact information. If a potential respondent was busy but wished to complete the survey at a different time, or was temporarily unavailable, a callback was scheduled. Respondents were also given the phone number of a Cohen Center researcher who they could call at their convenience to complete the survey. If a caller received additional contact information from a parent, roommate, friend, or other acquaintance of the respondent, that information was updated into the survey management system (SMS) and used for follow up. If a new email address was obtained, the caller sent a customized email with a link to the survey to that address via the SMS interface. If an answering machine was reached, a voicemail was left and if an email addresses was listed on file, a follow-up email was sent as well. Phone numbers were called multiple times over a period of about four months and multiple voice mails were left if the number could potentially be linked to the respondent. Most calling was done between the hours of 7pm and 9:30 pm EST, but callers also tried to reach respondents during the day, specifically when the known contact number was a work number or if respondents were known to live overseas and a time difference needed to be taken into consideration when calling. A series of scripts and scenarios were provided to callers to cover most calling scenarios (see Appendix 4). However, callers were advised to use their judgment when they reached a person and to make appropriate adjustments to the script.

Calling was carried out at the Cohen Center by a group of callers predominantly comprised of Brandeis University undergraduate and graduate students. All callers attended a training session led by a Cohen Center staff member. A calling supervisor was present at each calling shift and fielded questions and monitored the quality of interviews. Several of the most skilled callers were tasked with attempting refusal conversions. In general, the standard of interviewing was very high.

In cases where a Russian-speaking parent was reached, interviewers transferred the case to one of several native speakers of Russian on the interviewing staff. In addition, respondents with Russian names were allocated, where possible, to native Russian-speaking interviewers.

Searching and additional efforts

In some cases, callers failed to make contact with potential respondents or to verify contact information contained in the SMS. If the individuals in these cases were not included in the pre-survey searching effort, they were designated as “search” cases and a search procedure (previously described) was carried out to obtain new contact information. If new contact information was found, additional attempts were made to contact the respondent or an individual who might have additional contact information.

In an effort to reduce sample attrition, previous respondents who did not respond to the survey after three email invitations and four calling attempts were sent a paper letter asking them to take part in the survey. Paper letters were also sent to sample members who were searched for additional contact information. Mailing addresses were obtained through Accurint and letters were only sent to respondents if the address seemed to match other information in the SMS. All letters were mailed in envelopes with handwritten addresses. A total of 473 letters were sent. An additional round of calls was made to all individuals in this group who did not respond to the survey.

End of data collection

Data collection ended on September 3, 2013.
Final dispositions and outcome rates

Final dispositions for each case were coded by two independent coders using a scheme based on AAPOR’s standard definitions for email and phone surveys. The agreement rate between coders was very high (99%). Disagreements were resolved by discussion between the coders. Attempts were made to contact 2,859 individuals in the course of data collection for Wave 4 of the study. Interviews were conducted with 2,076 eligible respondents. One hundred and eleven individuals who were contacted in Wave 4 explicitly refused to take the survey. The overall response rate calculations consider all eligible sample members, even those for whom no attempt at contact was made. Response Rate 3 (RR3) estimates what proportion of cases with unknown eligibility is actually eligible and includes them in the denominator. Response rate 4 (RR4), reported here, allocates cases of unknown eligibility as in RR3 but also includes partial interviews (AAPOR, 2009). The overall response rate (AAPOR RR4) was 65.6 percent. Response rate calculations treat eligible individuals who were not surveyed in Wave 4 (because they had previously refused or had no potential for contact) as nonrespondents. The final dispositions and outcome rates for Wave 4 are detailed in the table below:

Table 6. Final dispositions and outcome rates for respondent interviews Wave 4.

By considering the participation status of each ineligible individual as it was recorded in the Taglit registration database, it is possible to estimate the proportion of cases of unknown eligibility that are eligible within the nonparticipant and participant categories. The estimate is 81.4 percent for nonparticipants and 99.3 percent for participants. Therefore, AAPOR Response Rate 3 is 53.9 percent for nonparticipants and 71.5 percent for participants.

**Weighting**

**Design weights**

The design weights for a stratified survey are simply the inverse of the probability of selection:

\[ w_h = \frac{N_h}{n_h} \]  

(3)

where \( n_h \) is the achieved sample in stratum \( h \) and \( N_h \) is the population size of stratum \( h \). Thus, each case is assigned a weight equal to the number of elements in the population of the frame it “represents.”

However, as in previous studies, the large number of strata proved problematic, as strata were sometimes represented by a single sampling unit in analyses, thereby preventing the calculation of the standard error. Therefore, strata were collapsed by gender to alleviate this problem. This resulted in 18 exhaustive and mutually exclusive weighting strata \((l = 1, 2, ..., H)\) based on round, age and participant status. Thus design weights \((w_l)\) were calculated as:

\[ w_l = \frac{N_l}{n_l} \]  

(4)

One unfortunate side effect of the decision to collapse strata by gender is that it renders design weights unable to correct for any over- or under-sampling of gender within rounds. This is not an issue for the 2005 or 2006 cohorts, but in the original sample (years 2001 to 2004) gender was not balanced within rounds. Gender was, however, balanced in the overall in the original sample. Consequently, the design weights alone do not produce correct estimates for the proportion of males and females within the first four waves. However, the post-stratification raking (discussed below) resolves this issue and produces accurate estimates of gender (and all other stratification variables) for every round.

As in previous years, during the course of data collection, it was found that some cases that had been assigned to nonparticipant strata were actually participants. While this often led to cases being declared ineligible, in other situations the case remained eligible, where the case had a participation status other than the sampling strata to which it was assigned. The goal of design weights is to compare the achieved sample to the frame population it represents. Thus, a new stratum variable was created with the same criteria as the old stratum variable, using the “updated” participation variable to assign cases to strata. This ensured that cases were given a weight corresponding to the frame subpopulation to which they actually belong.

**Poststratification weights**

Having defined the design weights, poststratification weights were then calculated in order to adjust for any differences between the distribution of known characteristics of the sample and known characteristics of the frame (which were derived from the Taglit registration database). Post
stratification raking forces weighted marginals for respondents on selected variables to equal the appropriate “target” values in the registration database. In addition to the characteristics used in initial stratification (participant status, year of birth, and sex), information on denomination at time of application to the trip was available for the 2003, 2004, 2005, and 2006 rounds and for part of the 2002 round. Post-stratification weights were calculated separately for each round, for a number of reasons. Firstly, raking each round separately allows for correction of over- or under-sampling of males or females in a given round, which was unaddressed by the design weights due to the need to collapse strata by gender. Secondly, since the availability of contact varies by round, each round can be raked only on variables that exist for applicants in that round.

Poststratification weights ($w_j$) were created by raking within each round, where the sum of the weights was set to remain constant. Unlike design weights, which remain constant within weighting stratum, poststratification weights can vary across cases within weighting stratum. For the 2001 round (weighting strata 1 and 2), raking took place on year of birth and sex. Since all 2001 cases were participants, participation status was not included. For the 2002 round (weighting strata 3, 4, 5, and 6), marginal frequencies were raked to population frequencies for year of birth, sex, participation status, and denomination at time of trip, where cases with unknown denomination were treated as a separate category. The remaining rounds (2003-06) were raked separately on year of birth, sex, participation status, and denomination. These raked weights were the final weights used in all analyses.

Calculation of Confidence Intervals

Confidence intervals in this report were calculated at the 95 percent level using Stata’s (2011) survey commands. These were set up for a stratified survey (where the strata are defined as the weighting strata) with simple random sampling within strata. Any re-estimation of these survey data that does not take into account the complex survey design will result in incorrect calculation of confidence intervals (in general, the degree of error will be underestimated). Unweighted re-analyses will result in incorrect point estimates and confidence intervals.
Appendix B: Tables

The regression models and estimated margins that support the analyses in the report are presented below. Table 1 describes the variables found in the output below.

Table 1. Description of variables.

<table>
<thead>

Marriage

The regression models and estimated margins that support the analyses in the “Marriage” section of the report are presented here. For the analysis of inmarriage, two-way tables of frequencies are also presented.

Table 2. Multinomial logistic regression of marital and cohabitation status on age and Taglit participation.

Note: Parental inmarriage omitted from model because not significantly related to marital and cohabitation status.

Survey: Multinomial logistic regression

Appendix C: Survey Instruments

See the following pages for the OLD respondents survey and NEW respondents survey.
Thank you for your continued participating in Brandeis University's study of {TOKEN:ATTRIBUTE_9}. We're looking forward to learning about what is new in your life since you last completed the survey.

This short follow-up survey will take about 10 minutes to complete. When you are done you will receive a $25 Amazon.com gift card to thank you for your time!

Your responses are very valuable - they help us understand the interests and choices of people like you.

This survey is conducted by the Cohen Center for Modern Jewish Studies at Brandeis University. Your individual responses will be kept strictly confidential.

To begin the survey click on the "Next" button below.

If you have any questions or difficulty accessing the survey, email us at study@brandeis.edu or call Dina Bleckman at 781-736-3821.

Thank you,
Leonard Saxe, PhD
Director
Cohen Center for Modern Jewish Studies
Brandeis University
www.brandeis.edu/cmjs

There are 179 questions in this survey

About You

1 [AYboiler]We will start off by asking you a few questions about yourself.

2 [country]Do you currently live in...?

Please choose only one of the following:

Only answer this question for the items you selected in question 0 (""

Only answer this question for the items you did not select in question 0 ("

- The United States
- Canada
- Israel
- Another country (please specify):
3 [ZIP] What is the ZIP code where you currently live?

Only answer this question if the following conditions are met:
° Answer was 'The United States' at question '2 [country]' (Do you currently live in...?)

Please write your answer here:

4 [CANzip] What is the postal code where you currently live?

Only answer this question if the following conditions are met:
° Answer was 'Canada' at question '2 [country]' (Do you currently live in...?)

Please write your answer here:

5 [ownhome] Thinking about the home you live in, do you...

Please choose only one of the following:

Only answer this question for the items you selected in question 0 (°)

Only answer this question for the items you did not select in question 0 (°)

☐ Own
☐ Pay rent
☐ Live in the home of relatives or friends without paying rent
☐ Other

6 [Phone] In your home do you have...

Please choose the appropriate response for each item:

Only answer this question for the items you selected in question 0 (°)

Only answer this question for the items you did not select in question 0 (°)

Land line/s
☐ Yes ☐ No

Cell phone/s
☐ Yes ☐ No

7 [student] Are you currently a student in a degree-granting program at a college or university?

Please choose only one of the following:

☐ Yes
☐ No
8 [schooltype] What level of schooling are you currently enrolled in?

Only answer this question if the following conditions are met:
° Answer was 'Yes' at question 7 [student] (Are you currently a student in a degree-granting program at a college or university?)

Please choose only one of the following:

Only answer this question for the items you selected in question 0 (' * ') 
Only answer this question for the items you did not select in question 0 (' * ')

- Associates degree (AA, AN, etc.)
- Bachelors degree (BA, BS, etc.)
- Masters degree (MA, MBA, MSW, etc.)
- Professional degree (JD, MD, etc.)
- Doctoral degree (PhD, etc.)
- Other

9 [schoolyr] Are you currently a...?

Only answer this question if the following conditions are met:
° Answer was 'Yes' at question 7 [student] (Are you currently a student in a degree-granting program at a college or university?) and Answer was 'Bachelors degree (BA, BS, etc.)' at question 8 [schooltype] (What level of schooling are you currently enrolled in?)

Please choose only one of the following:

Only answer this question for the items you selected in question 0 (' * ') 
Only answer this question for the items you did not select in question 0 (' * ')

- First year (Freshman)
- Second year (Sophomore)
- Third year (Junior)
- Fourth year (Senior)
- Other (please specify):
10 [degree] What is the last grade or level of schooling you have completed?

Please choose only one of the following:

- High school or less
- Associates degree (AA, AN, etc.)
- Bachelors degree (BA, BS, etc.)
- Masters degree (MA, MBA, MSW, etc.)
- Professional degree (JD, MD, etc.)
- Doctoral degree (PhD, etc.)

- Other. Please explain
11 [undrgradjewact] As an undergraduate, how active were you in...?

Only answer this question if the following conditions are met:

°

-------- Scenario 1 --------

Answer was 1 'Associates degree (AA, AN, etc.)' or 'Bachelors degree (BA, BS, etc.)' at question '8 [schooltype]' (What level of schooling are you currently enrolled in?) and Answer was 2 'Associates degree (AA, AN, etc.)' or 'Bachelors degree (BA, BS, etc.)' at question '8 [schooltype]' (What level of schooling are you currently enrolled in?)

-------- or Scenario 2 --------

Answer was -oth- 'Associates degree (AA, AN, etc.)' or 'Bachelors degree (BA, BS, etc.)' or 'Masters degree (MA, MBA, MSW, etc.)' or 'Professional degree (JD, MD, etc.)' or 'Doctoral degree (PhD, etc.)' at question '10 [degree]' (What is the last grade or level of schooling you have completed?) and Answer was 2 'Associates degree (AA, AN, etc.)' or 'Bachelors degree (BA, BS, etc.)' or 'Masters degree (MA, MBA, MSW, etc.)' or 'Professional degree (JD, MD, etc.)' or 'Doctoral degree (PhD, etc.)' at question '10 [degree]' (What is the last grade or level of schooling you have completed?) and Answer was 3 'Associates degree (AA, AN, etc.)' or 'Bachelors degree (BA, BS, etc.)' or 'Masters degree (MA, MBA, MSW, etc.)' or 'Professional degree (JD, MD, etc.)' or 'Doctoral degree (PhD, etc.)' at question '10 [degree]' (What is the last grade or level of schooling you have completed?) and Answer was 4 'Associates degree (AA, AN, etc.)' or 'Bachelors degree (BA, BS, etc.)' or 'Masters degree (MA, MBA, MSW, etc.)' or 'Professional degree (JD, MD, etc.)' or 'Doctoral degree (PhD, etc.)' at question '10 [degree]' (What is the last grade or level of schooling you have completed?) and Answer was 5 'Associates degree (AA, AN, etc.)' or 'Bachelors degree (BA, BS, etc.)' or 'Masters degree (MA, MBA, MSW, etc.)' or 'Professional degree (JD, MD, etc.)' or 'Doctoral degree (PhD, etc.)' at question '10 [degree]' (What is the last grade or level of schooling you have completed?) and Answer was 6 'Associates degree (AA, AN, etc.)' or 'Bachelors degree (BA, BS, etc.)' or 'Masters degree (MA, MBA, MSW, etc.)' or 'Professional degree (JD, MD, etc.)' or 'Doctoral degree (PhD, etc.)' at question '10 [degree]' (What is the last grade or level of schooling you have completed?)

Please choose the appropriate response for each item:

Only answer this question for the items you selected in question 0 ('*')

Only answer this question for the items you did not select in question 0 ('*')

Trigger

184 [trigger]Thinking about the past year, what was your most memorable Jewish experience?

Please write your answer here:
Please fax your completed survey to: Submit your survey.
Thank you for completing this survey.
Notes

i Methodological appendices (Saxe et al., 2009) contain in-depth discussion on the sampling and stratification schemes for these cohorts.

ii The criteria for eligibility to the program for the 2001-2006 trips were: Being 18-26 years old at time of trip, being Jewish, not having participated in a peer trip to Israel or a study abroad program in Israel, and not studying in a Yeshiva, seminary or other Jewish studies program prior to application to Taglit.

iii Taglit applicants in this study were eligible to participate in the program if they considered themselves to be Jewish, were between 18 and 26 years of age, had not previously gone to Israel on a “peer educational trip” and were not enrolled in a full-time Jewish studies program.

iv An additional 11 cases were initially in the group to be surveyed in Wave 4, but after the survey was launched it was determined that they were ineligible for the study. These cases are not included in these figures.

v Cohen Center staff made some modifications to the source code of Lime Survey before using it for this study (LimeSurvey is open-source software released under the terms of the GNU General Public License v. 2). These modifications were mainly to allow greater compatibility between Lime Survey and the in-house CATI and bulk-email sending systems.

vi In previous waves of the study final dispositions were calculated only for those individuals for whom contact attempts were made. These calculations therefore did not include individuals who had previously refused to take the survey, or were did not have sufficient contact information to warrant contact attempts. Consequently, response rates reported in previous waves reflect the rate of response for those for whom actual attempts at contact were made. This report considers all eligible sample members when calculating the response rate.

vii Raking was carried out using QBAL (Werner, 2003).
