A postdoctoral fellow position is available in the group of Michael Hagan in the Physics Department at Brandeis University to study the assembly of microtubules and viral capsids, using a combination of coarse-grained and atomic-resolution simulations. The position will involve a close collaboration with the experimental group of Zvonimir Dogic in Brandeis Physics and will be a part of the Brandeis MRSEC (http://www.brandeis.edu/mrsec/) on “Constraints and Frustration in Nano-Structured and Bio-Molecular Materials”. There will also be ample opportunities to interact with other experimental and theoretical biophysics labs at Brandeis. The ideal candidate would have experience in performing large-scale simulations and a PhD in biophysics, condensed matter physics, chemistry, or a related field.

Candidates interested in this position should send their curriculum vitae by e-mail to hagan@brandeis.edu, and indicate "postdoc application" in the e-mail subject line. The position is available until filled.

Brandeis University is located in Waltham, MA, just outside of Boston.

Brandeis University is an equal opportunity employer, is committed to building a culturally diverse intellectual community, and strongly encourages applications from women and minorities.
