Joey Flyer-Adams is a doctoral candidate in Neuroscience at Brandeis University where she uses fruit flies to study how your circadian clock affects your learning and memory. When not messing with fruit fly genetics or fancy microscopes, Joey is a Fellow with the Brandeis Science Communications Lab where she is a coach of effective visual, written and oral scientific content. Joey is also the inventor of FlyBuilder, a teaching tool and curriculum that helps students understand the theoretical and practical aspects of working with genetically altered fruit flies.

Not too shabby for a college dropout, right? Come hear Joey talk about how amnesia, art and willful independence helped her forge a nontraditional path, and how her hobbies became assets for a successful scientific career.
